

MS Flycatcher

POWDER

MS FLYCATCHER uses a potent attractant bait in the form of a powder containing yeasts and other ingredients authorised for dietary use. This special formula combined with an innovative manufacturing method has made it possible to obtain a bait with a potent attractant action on the most common fly species.

TRAP

MS FLYCATCHER is the other indispensable element for the perfect operation of the catch system. It consists in a cylindrical container with a 11-litre capacity, provided with a transparent lid and 6 holes around its circumference, each one fitted with a mesh cone featuring a special "ONE-WAY" design that ensures that once flies have entered the container, they are no longer able to escape.

HOW IT WORKS

The powder attractant is poured into the MS FLYCATCHER and diluted with water as indicated in the instructions for use. The trap reaches maximum efficacy 12-24 hours after activation: the attractant action of the odours generated by the complete fermentation of the powder dissolved in water lures flies into the trap through special "one-way" cones and once they are inside, they are unable to escape.

USE DIRECTIONS

- Pour the powder into the MS Flycatcher.
- Add 6 litres of water and stir well.
- Position the trap outdoors around livestock housing and other buildings to form a protective barrier against flies (for best results, position away from materials that could interfere with the system's attractant action, such as manure heaps, cesspits and collections of fermented organic matter).
- Hang or position the trap prepared as described above in the area to be protected at a height of approximately 100-150 cm from the ground. Each trap protects an area of approximately 200-300 m². MS Flycatcher is effective for approximately 60 days after activation, depending on factors such as temperature, location and weather conditions. At the end of the efficacy period, eliminate the contents and reactivate the MS Flycatcher using a new solution of attractant power.
