MS Schippers

Passion for Farming

ANIMAL-FRIENDLY

There are many disadvantages to the current ways of euthanising. They are often aesthetically tough, expensive, require certain technical skills or are painful. Immersion in the foam quickly makes the pigs unconscious, followed by a painless, stress-free death.

PAINLESS

MS Nitrogen creates an oxygen deficiency in tissues and organs. This causes the animals to rapidly become unconscious and die quickly, without suffering pain.

SAFE

MS Nitrogen is easy to use, safe and not stressful for people. MS Nitrogen fits in well with animal welfare, is effective, efficient and has few risks and limitations.

MODE OF OPERATION

MS Nitrogen uses nitrogen. Foam is produced with the use of nitrogen. The foam consists 99% of nitrogen. The sick pigs are immersed in the foam which only contains nitrogen.

USER-FRIENDLY

The system is easy to operate and technically very reliable. MS Nitrogen does not contain any electronic components. This significantly reduces the risk of technical failures.

HYGIENIC

Since MS Nitrogen does not contain any electronic components, cleaning and disinfection with an HD cleaner is much easier.

AFFORDABLE

In addition, it is a very affordable device, making it attractive for every pig farmer to euthanise in an animal-friendly way.
